**Pre-Operative Diagnosis:** CRF (chronic renal failure) (Working), ESRD (end stage renal disease) (Working), Kidney transplant status (Working).  
**Post-Operative Diagnosis:** CRF (chronic renal failure) (Working), ESRD (end stage renal disease) (Working), Kidney transplant status (Working).  
**Operation Performed:** renal trasnplant exploration .

### Indication for Surgery

active bleeding ( hematoma )

### Position

Supine

### Intraoperative Findings/Description

follycath inserted , time out done , after prep and drep, wound explored.  
Removed a lot of clot around the kidney extending up to liver  
decapsulated kidney due to active bleeding from the hilum of transplant kidney  
Multiple trial of control bleeding by simple sutures was not successful.  
Applying a lot of blood stop and surgicell as packing on the site of active bleeding with prolene suturing through and through.  
Tissel gel applying for hemostasis.  
kidney good perfusion and good pulse in renal vessels, Doppler audible.  
Dr Jameel joint the OR for opinion , and agree to keep the kidney  
Dr Habhab contacted over the phone and we ask him regarding the kidney biopsy result and prognosis of the graft, his opinion better to keep the kidney.
